

RS/Print Control makes it easy to run your reports.

You are asked to develop a new report. Time is of the essence so you create the report with Seagate's Crystal Reports. You run the report and show the output to your users. They love the report, BUT want the report run daily. Also while you are at it can you make a slight change to the criteria you use to run the report with. Now what do you do?

Allowing your users to run reports created in crystal reports should be as easy as it is to create the report. RS/Print Control makes it that easy. Providing parameters that are numeric, alphanumeric, and/or date ranges is a cinch. Sorting the report in Ascending or Descending order can be the users choice. Accepting options does not phase the control. And best of all the report can be run from Excel, Word, Visual Basic or any system that supports the VBA programming language.

With RS/Print Control, Reference Systems makes it easy to integrate your great reports in to the systems that your users are familiar with.
